                                                                                                                                                                                                                                                                                                                        The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3 KVEAILRPWRVSQVSSALLKIGIRGVTVSDVRGFGAQGGSTERQGGSEFSEDKFVAKVRM 62

                    of sites expressing (II). (I) and (III) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent din not appear in the printed specification, but was obtained in ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fine chemical production; organic acid; proteinogenic amino acid; nonproteinogenic amino acid; proteinogenic amino acid; proteinogenic amino acid; purine base; pyrimidine base; nucleoside; nucleotide; lipid; saturated fatty acid; unsaturated fatty acid; carbohydrate; aromatic compound; vitamin; cofactor; polyketide; diagnosis; corynebacterium diphtheriae; genetic engineering; Brevibacterium; environmental condition.
supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are neeful for forting.

AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis
and adaptation (HA) proceins given in AAB79023 to AAB79242. The C.
and adaptation (HA) proceins given in AAB79023 to AAB79242. The C.
glutamicum HA genes (I) can be used in vectors for expression in host
cells and production of fine chemicals, such as, an organic acid,
proteinogenic or nonproceinogenic amino acid (preferred), purine or
pyrimidine base, nucleoside, lipid, saturated or unsaturated
fatty acid, diol, carbohydrate, aromatic compound, vitamin, cofactor,
calveride or enzyme. The amino acids produced can be lysine, glutamine,
cysteine, valine, leucine, isoleucine, arginine, prodine, methionine,
cysteine, valine, leucine, isoleucine, arginine, prodine, histidine,
tyrosine, phenylalanine, or tryptophan. The fine chemical production can
be modulated. The presence of (I) or HA proteins encoded by then are used
for diagnosing the presence or activity of Corynebacterium diphtheriae.
(I) can be used to map the C. glutamicum genome or can be used as markers
for genetically engineered Corynebacterium or Brevibacterium. The HA
c proteins encoded by the (I) are used to maintain homeostasis in C.
glutamicum or help the microorganism to adapt to different environmental
                                                                                                                                                                                                                                      New isolated Corynebacterium glutamicum nucleic acid for production or modulation of production of fine chemicals such as amino acids, nucleosides, nucleotides, lipids, fatty acids, carbohydrates, vitamins or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        83

The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB3300-ABB5561). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related acid sequence, particularly to identify Lactococcus lactis or related in lactic bacterian of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent electronic format directly from WIPO at the wipo.int/pub/published 18-OCT-2001) which is available in standardise OS field) 3 KVEAILRPWRVSQVSSALLKIG-IRGVTVSDVRGFGAQGGSTERQGGSEFSEDKFVAKVK 61 2; Gaps 39.1%; Score 218; DB 5; Length 112; 43.2%; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C -1- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GS GENE (GLNA). P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF NR-1 TO NR-1-POSPHORYLATED THESE EVENTS ARE REVERSED (BY SIMILARITY).

C -1- FUNCTION: IN NITROGEN-LIMITING CONDITIONS, WHEN THE RATIO OF GLN TO 2-KETOGLITARATED BECREASES, P-II IS PHOSPHORYLATED WHICH ALLOWS THE DEADENLYLATION OF GLUTAMINE SYNTHETASE (GS), THUS ACTIVATING THE ENDERNIT: HOMOTIME (BY SIMILARITY).

C -1- FUNCTION: THE ENDERNITATION OF GLUTAMINE SYNTHETASE (GS), THUS ACTIVATING THE ENDERNIT: HOMOTIME (BY SIMILARITY).

C -1- PIM: PHOSPHORYLATION DEPENDENT ON THE NITROGEN SOURCE AND SPECTRAL LIGHT QUALITY (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Plant Mol. Biol. Rep. 13:333-335(1995).

-i- PUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GLUTAMINE SYNTHETASE GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I TO NR-I PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-II IS URIDYLYMANED TO P-II-UMP, THESE EVENTS ARE REVERSED. WHEN THE RATIO OF GLN TO 2-KETOGLUTARATE DECREASES, P-II IS URIDYLYMATED TO P-II-UMP, WHICH CAUSES THE
       TO 2-KETOGLUTARATE DECREASES, P-II IS URIDXIXIATED TO P-II-UMP.

PII-UMP ALLOWS THE DEADENTLIMENTON OF GAUTAMINE SYNTHEIASE (GS), THUS ACTIVATING THE BEADENTLYIMENTON OF GAUTAMINE SYNTHEIASE (GS).

IS DEURIDYLATED AND PROMOTES THE ADENYLATION OF GS.

UNCTION: P-II INDIRECTIX CONTROLS THE RENSCRIPTION OF THE GS GENE (GINA). P-II PREVENTE NR-II CATALYZED CONVERSION OF THE GS NR II PREVENTEN NR-II CATALYZED CONVERSION OF NR-I TO NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GINA. WHEN P-II SURINITIALEND TO P-II-UMP, THESE EVENTS ARE REVERSED.

SUBUNIT: HOMOCLTIMEN (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Complete nucleotide sequence of the Porphyra purpurea chloroplast

"Nuclectide sequence and characterization of the Rhodobacter
sphaeroides glnB and glnA genes.";
Microbiology 140:2143-2151(1994).
-! FUNCTION: P-II INDIRECTLY COMTROLS THE TRANSCRIPTION OF THE
GLUTAMINE SYMTHETASE GENE (GLNA). P-II PREVENTS NR-II CATALYZED
CONVERSION OF NR-I TO NR-I-PHOSPHATE, THE TRANSCRIPTIONAL
ACTIVATOR OF GLNA. WHEN P-II IS URIDYLYLLATED TO P-II-UNP, THESE
BUCKRASES, P-II IS URIDYLYLATED TO P-II-UNP, WHICH CAUSES THE
DEADENYLYLATION OF GLUTAMINE SYNTHETASE, SO ACTIVATING THE ENZYME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3 KVEAILRPWRVSQVSSALLKIGIRGVTVSDVRGFGAQGGSTBRQGGSEFSEDKFVAKVKM

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The SP6 end of T7B11 is occiented toward the centromere and overlaps with T10M13, GenBank accession number AF001308. There are no discrepancies found in these independently finished overlaps. The region from position 110064 to 110253 exists as single stranded and single chemistry. Please see the feature below for details.
